# Scenario:

You go to the University of South Carolina and you have just finished your first weekend of the college experience! You have made many friends and have gone to many different dorms to meet new people. The problem is, we are in the midst of a pandemic! These dorms are cramped and overpopulated and you end up catching covid! You are told to download the universities "Covid Housing Help" app, designed by students. You get placed into quarantine and stay there for a few days before realizing your laundry is piling up! You realize laundry can be managed through the app, and decide to try it out.

Task 1: Open the app and enter your full name and the case number given to you when you were first diagnosed with the virus.

Task 2: Select from the menu of things you would like to manage! In this case, your laundry.

Task 3: Set a pick-up time and a drop-off time and choose whether the laundry set outside your door is colors, whites or both! (If both, select both and have them separate already outside your door.) Finally press confirm and let the building staff take care of you!

# Notes:

What changes you should make to your application (min 3 Things):
- I should add the fact that if you want both colors and whites, add text to this screen saying to place these two in different bags with some sort of label so the workers know which is which.
- Have another option for the user to select woolens and other delicates that may not do well in a normal cycle.
- Allow the user to select things to air dry so they do not shrink in the dryer.

What you need to keep the same for your application (3 Things):
- Keep the menu of things to manage, very intuitive and simple.
- Keep the pick-up time and drop-off time, allows for streamlined assistance and can help you manage your schedule/daily tasks.
- Keep the same login parameters (Full name and Case number)
